4.2.1	James-Lange Theory	12
4.2.2	Cannon-Bard Theory	13
4.2.3	Schachter-Singer Two-Factor Theory	13
4.2.4	Lazarus Cognitive-meditational Theory	13
4.2.5	Discriminating Between Theories	13
5	Conclusion	15
5.1	Recap	15
	Key Terms	15
	Key Terms	16

1 Overview and Introduction

1.1 Textbook Learning Objectives

- Define intrinsic and extrinsic motivation
- Understand that instincts, drive reduction, self-efficacy, and social motives have all been proposed as theories of motivation
- Explain the basic concepts associated with Maslow's hierarchy of needs
- Describe how hunger and eating are regulated
- Differentiate between levels of overweight and obesity and the associated health consequences
- Explain the health consequences resulting from anorexia and bulimia nervosa
- Explain the major theories of emotion

1.2 Instructor Learning Objectives

- Connect different needs with previously covered topics such as development, humanistic psychology, biopsychology
- Understand how our physical body and structures continue to play a role in our behavior, affect, and cognition
- Start to see how psychological dysfunction can arise to clinically-concerning conditions

1.3 Introduction

 Discuss: What *motivated* you to come to class / start the lecture video - why are you here, doing this?

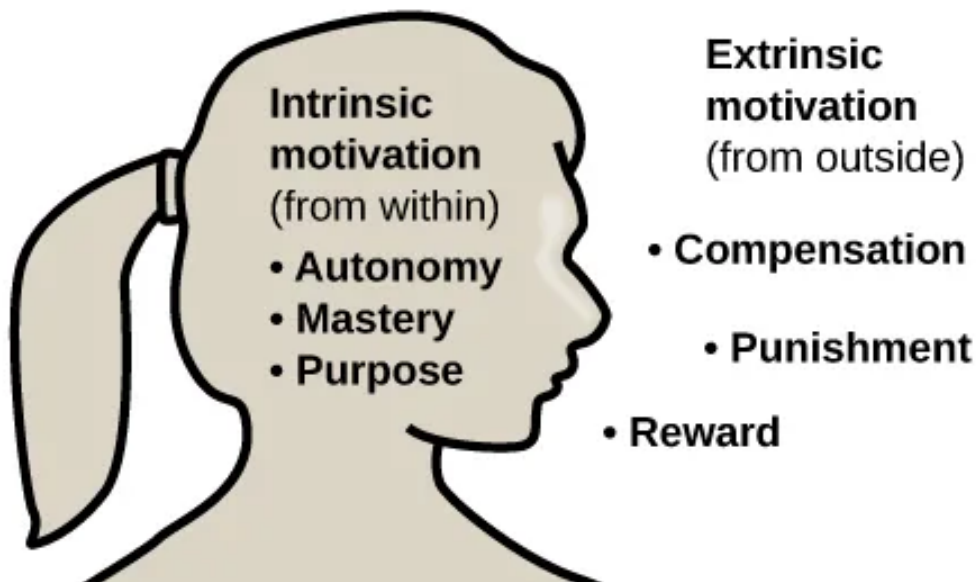

- Before we _____ a certain way, we have to have some _____ to do so.
 - There will be several _____ of motivation to memorize as part of this unit, much like how we had several theories of learning to learn
 - And our _____ tend to modify our motivation at the same time!

- Our motivation is _____ and guided by many different desires, _____, and influences
 - Thus, our behavior resulting from the motivation is also not _____

2 Motivation

2.1 Introduction

- **Motivation** is our _____ and needs that direct behavior towards a certain goal. There are two types:
 - **Intrinsic motivation** is that which is _____ due to outside reward but is fully _____
 - * E.g., I want to learn how to play the trumpet because I want to feel like I can overcome a challenge
 - **Extrinsic motivation** is that which is _____ and motivated by things like compensation, punishment, and reward
 - * E.g., I want to work hard in school so that I can get a job that pays me a lot of money

 Discuss: What are the different reasons people go to college? Would you describe these as intrinsic or extrinsic motivation?

2.2 Relationship Between Intrinsic and Extrinsic Motivation

- In general, _____ motivation is more fleeting, and tends to be less effective given enough time
- The **overjustification effect** is an example of this: if we are continuously given extrinsic _____ for something we find intrinsically pleasing, we might lose the intrinsic value
 - E.g., I like programming as a hobbyist, but many software developers dream of being farmers
 - However, this effect doesn't appear to _____ be true

Important

Like most things we learn, it is more complicated than one thing **always** being true

- Evidence suggest that _____ and tangible reinforcement, like money and other forms of compensation have a more negative impact on intrinsic motivation, whereas _____ reinforcement of praise has less of a harmful effect

 Discuss: What is something you enjoy doing - but wouldn't ever want to do as a full-time job?

2.3 Connection to Education

- In education, evidence suggests that students feel more intrinsic motivation to do well when they feel a sense of _____, respect, and safety
 - This is why instructors _____ make efforts to keep good rapport

 Discuss: What are the things in this class that *help* your sense of belonging? What about things that *hurt* your sense of belonging? Does one outweigh the other?

2.4 Theories on Motivation

- You should be able to understand and identify the differences between the following theories

2.4.1 William James' Instinct Theory

 Which historical perspective was William James connected to in Module 1?

- A) Structuralism
- B) Functionalism
- C) Biopsychology
- D) Behaviorism

Explanation:

- James' thoughts on motivation revolved around [instincts](#)
 - E.g., suckling from mother, predatory-prey interactions
 - James' was fairly radical in saying that instincts account for quite a bit of motivation

2.4.2 Homeostasis Theory

- Another early view places emphasis on **homeostasis**
 - This is our body's tendency to maintain _____ in our various body systems
 - E.g., our body constantly reminding us to sleep via yawning due to the circadian rhythm of sleeping

? If our hormones are out of whack, what part of the ****endocrine system**** will help direct the production and management of the hormones?

- A) Pituitary
- B) Pineal
- C) Testes
- D) Liver

Explanation:

- **Drive theory** posits that our _____ is a result of our body attempting to maintain homeostasis through various means
 - E.g., Eating to raise blood sugar back to normal, _____ level

🔊 Discuss: Other than sleep or eating, what other natural drives might we have that motivate us to behave a certain way?

2.4.3 Social Motivation

- **Social motivation** may also be very _____ in our behaviors
 - This is related to our desire to be socially-accepted and seeking these 3 things:
 - * _____, e.g., succeeding in something

- * _____, e.g., being in a group
- * _____, e.g., our desire to be close romantically and/or platonically to others
 - E.g., your mom saying, “If your friends jumped off a bridge...”
- We have a sense of **self-efficacy**, which is our _____ we are capable of doing a certain task
 - E.g., When I need to sit down and write a lecture, I tell myself I am capable of getting it done
 - Low self-efficacy can _____ us from actually attempting
 - E.g., If I feel like I'll fall while ice-skating and that I won't get the hang of it, I may resist going

? If I have a low self-efficacy I am [BLANK] likely to try a challenging task

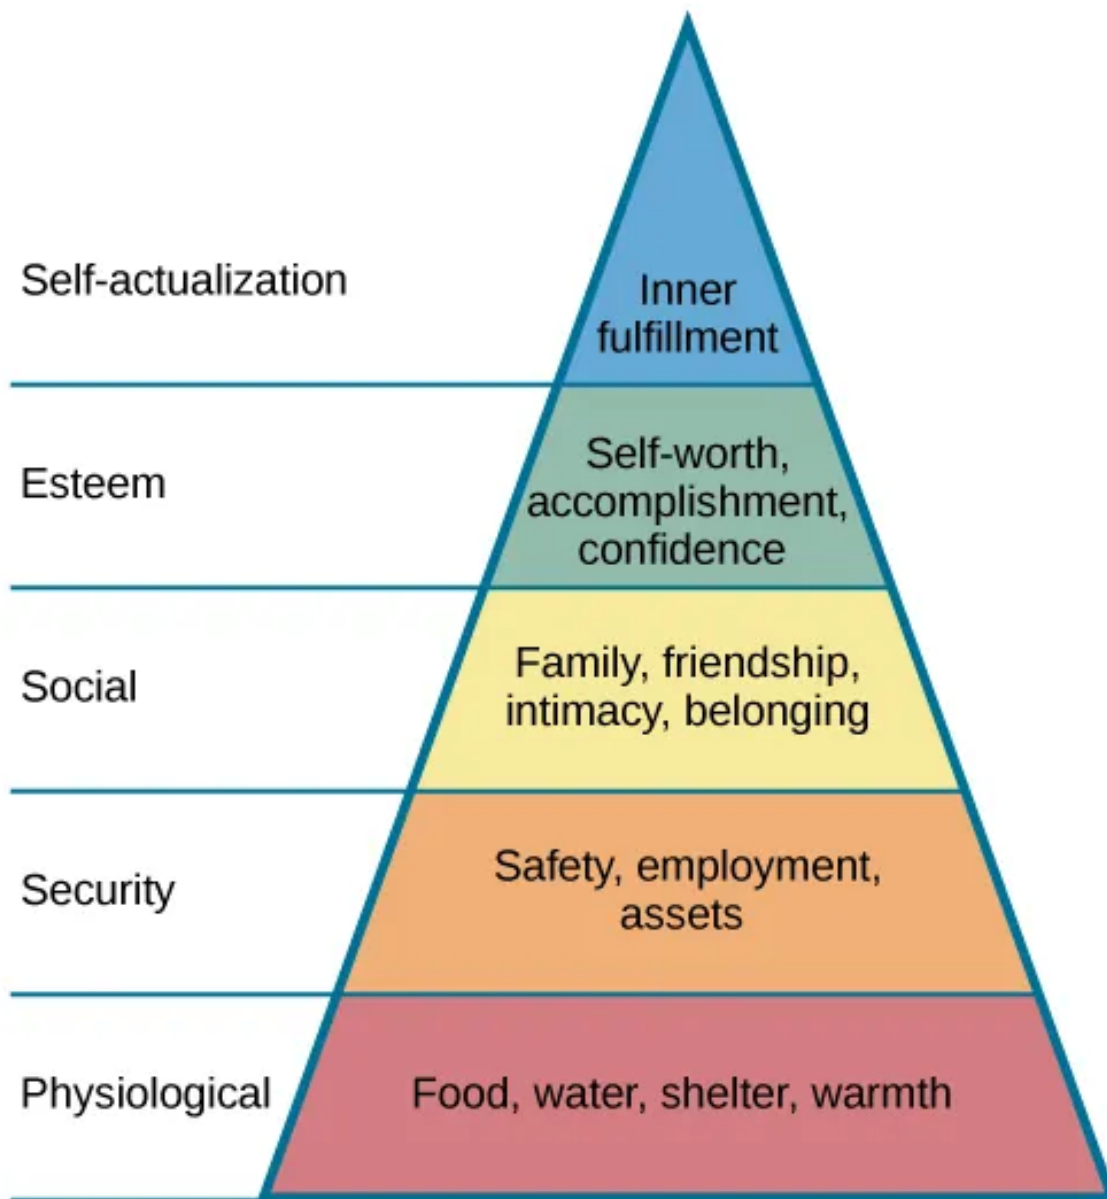

- A) More
- B) Less
- C) NA
- D) NA

Explanation:

2.4.4 Maslow's Hierarchy of Needs

- Abraham Maslow proposed a famous **hierarchy of needs**

Maslow's Hierarchy of Needs

? Maslow came up briefly in module 1, what historical perspective was he a *reaction* to?

- A) Cognitivism
- B) Behaviorism
- C) Functionalism
- D) Humanism

Explanation:

3 Hunger and Eating

3.1 Introduction

- Hunger is one of our _____ motivators, as it helps ensure we eat enough food to survive

? If a modern psychologist were studying the development of a sense of hunger as a means of fitness to survive, they would be best classified under:

- A) Biopsychology
- B) Cognitive Psychology
- C) Clinical Psychology
- D) Evolutionary Psychology

Explanation:

3.2 Physiological Mechanisms

🔊 Discuss: Review: describe the entire process of the production of melatonin in the endocrine system, starting with the light coming in the eyes

- Like many of our functions, e.g., sleep, it is much more _____ than it may seem!
- _____ for hunger:
 - Stomach _____ → hunger pangs/cramps
 - Chemical _____ signals sent in brain → psychological desire for food
 - Blood sugar drops → endocrine system makes chemical signals to induce hunger

? Which gland in the endocrine system controls the creation of insulin?

- A) Kidneys
- B) Pineal
- C) Liver
- D) Pancreas

Explanation:

- Once the hunger is met, we get to a point of **satiation**

3.3 Metabolism and Body Weight

- Body weight is complex, but does basically function on _____ in vs. _____ out
- However, our **metabolic rate** can be vastly different between people
 - E.g., this is why someone with “high metabolism” might appear to eat significant food with little change in their body
- One _____ explanation for our general tendency towards a certain weight is called **set-point theory**
 - However, this is not completely well-supported as a theory

! Important

Our ‘psychology’ involves a lot of functions in our body as they relate to how we act!

4 Emotion

4.1 Introduction

 Discuss: When was the last time you felt pure joy or peace - describe that time

- An **emotion** is a _____ state of being. Emotions are the combination of:
 - _____
 - _____
 - _____ appraisal
 - _____ responses
 - Together, these 4 things are called the **component of emotions**
- **Experiences** our the stimuli, which may be _____ or external that stir emotion
 - E.g., Watching a sad movie, hearing a funny joke
- **Expressions** are how we _____ our emotions through verbal and nonverbal behavior
 - E.g., Tears from sadness, Raising voice in anger
- **Cognitive appraisal** is our _____ of how an emotional experience will impact us
 - E.g., I judge that being told I am getting fired will have a profoundly bad impact on my wellbeing
- **Physiological responses** is how our body responds to emotion
 - E.g., sweating, heart racing

? When I am extremely happy, I start unconsciously bouncing up and down, this action would be best described as...

- A) Experience
- B) Expression
- C) Cognitive appraisal
- D) Physiological response

Explanation:

! Important

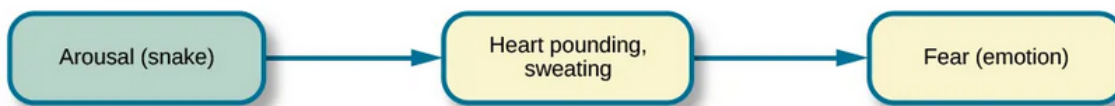

The following sections will make often use of these terms/descriptors, so please keep them in mind!

4.2 Theories of Emotion

- In the following figures and descriptions, consider the scenario where a man experience the emotion of fear from a snake
- Each of these theories differs primarily in how the different _____ of emotions are explained

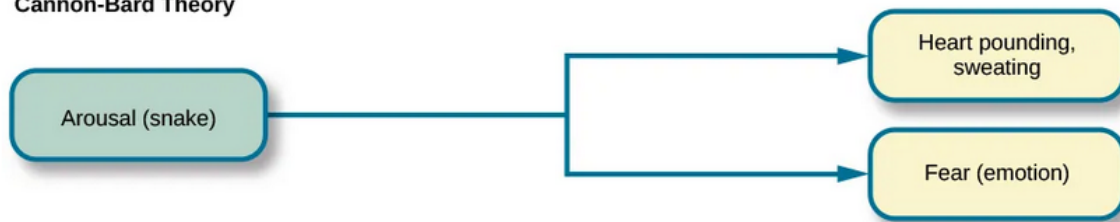

4.2.1 James-Lange Theory

James-Lange Theory

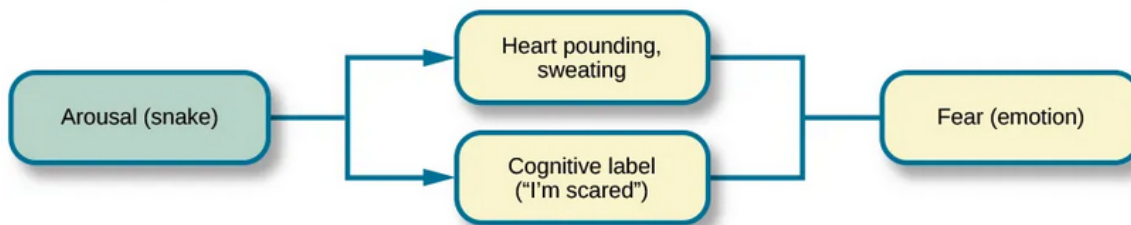

4.2.2 Cannon-Bard Theory

Cannon-Bard Theory

4.2.3 Schachter-Singer Two-Factor Theory

Schachter-Singer Two-Factor Theory

4.2.4 Lazarus Cognitive-meditational Theory

Lazarus' Cognitive-meditational Theory

4.2.5 Discriminating Between Theories

? I see a spider and begin to get tense and sweat, in turn becoming afraid. This best shows...

- A) James-Lange Theory
- B) Cannon-Bard Theory
- C) Schachter-Singer Theory
- D) Lazarus' Cognitive-meditational Theory

Explanation:

? I see a spider and begin to get tense and sweat while simultaneous recognizing that I am scared of the spider, in turn becoming afraid. This best shows...

- A) James-Lange Theory
- B) Cannon-Bard Theory
- C) Schachter-Singer Theory
- D) Lazarus' Cognitive-meditational Theory

Explanation:

? I see a spider and recognize it may very well be dangerous to me, in turn becoming afraid. This best shows...

- A) James-Lange Theory
- B) Cannon-Bard Theory
- C) Schachter-Singer Theory
- D) Lazarus' Cognitive-meditational Theory

Explanation:

5 Conclusion

5.1 Recap

- Motivation and emotion both have numerous theories that describe how we become motivated or emotional, respectively. You should be able to tell the differences between these theories
- Similarly, motivation and emotion both have numerous vocabulary terms associated with them to describe the individual parts!
- Hunger is an example of a natural motivation that we have, and goes to show how 'psychological' is a very broad term covering a lot of our bodily processes and how we react to them!

Key Terms

C

Cognitive appraisal Our understanding of how the experiences will affect us [11](#)
component of emotions The group of experiences, expressions, cognitive appraisal, physiological reactions making up emotions [11](#)

D

Drive theory Theory of motivation focused on need to maintain homeostasis [6](#)

E

emotion A subjective state of being; our feelings [11](#)

Experiences In context of emotions, some stimuli that modifies our emotions [11](#)

Expressions In context of emotions, how we physically show emotion through verbal and nonverbal behavior [11](#)

Extrinsic motivation Motivation which is external and influenced or directed by compensation, punishment, reinforcement, etc. [3](#)

H

hierarchy of needs A pyramid theorized by Abraham Maslow to demonstrate how fulfilling some needs is dependent on the prior addressing of previous needs [7](#)

homeostasis The body's natural tendency to seek an equilibrium or balance between various hormones, substances, and actions in our body [6](#)

I

instinct species-specific pattern of behavior that is not learned, naturally built-into us [5](#)

Intrinsic motivation Motivation which is internal and not influenced by outside reward, e.g., desire for autonomy, mastery, and purpose [3](#)

M

metabolic rate The rate at which we naturally burn calories in activity or rest [10](#)

Motivation Our wants and needs that direct behavior towards a certain goal [3](#)

O

overjustification effect The tendency for intrinsically pleasing actions to lose their intrinsic value when continuously rewarded extrinsically [4](#)

P

Physiological responses The bodily responses to emotion [11](#)

S

satiation Point at which we do not feel hunger by having taken in enough food [10](#)

self-efficacy Our internal, individual belief that we are capable of some action or task [7](#)

set-point theory A theory of body weight that posits each person has a natural weight range in which the body tends to stay in [10](#)

Social motivation Motivation primarily driven by social desires or needs [6](#)

The instructor-provided glossary may not include all terms worth memorizing, make sure you consider using the vocabulary list in your book and your own judgment to make sure you have all relevant terms

Key Terms
